

[LogFormat Directive]

Description:	Describes a format for use in a log file
Syntax:	LogFormat <i>format</i> <i>nickname</i> [<i>nickname</i>]
Default:	LogFormat "%h %l %u %t \"%r\" %>s %b"
Context:	server config, virtual host
Status:	Base
Module:	mod_log_config

Default:	LogFormat "%h %l %u %t \"%r\" %>s %b"
%h	Remote hostname. Will log the IP address if HostnameLookups is set to Off, which is the default. If it logs the hostname for only a few hosts, you probably have access control directives mentioning them by name.
%l	Remote logname (from identd, if supplied). This will return a dash unless mod_ident is present and IdentityCheck is set On.
%u	Remote user if the request was authenticated. May be bogus if return status (%s) is 401 (unauthorized).
%t	Time the request was received, in the format [18/Sep/2011:19:18:28 -0400]. The last number indicates the timezone offset from GMT
%r	First line of request.
%s	Status. For requests that have been internally redirected, this is the status of the <i>original</i> request. Use %>s for the final status.
%v	The canonical ServerName of the server serving the request.
